MRSA PREVENTION: A GUIDE FOR SCHOOLS
Helping to protect your staff and students from MRSA

WHAT IS MRSA?
MRSA stands for Methicillin resistant Staphylococcus aureus. It is a bacteria that has developed a resistance to most commonly used antibiotics.

WHAT IS COMMUNITY-ACQUIRED MRSA?
Outbreaks of MRSA are now being reported in schools, daycare centers and camps. These “community-acquired” MRSA infections, some severe enough to be fatal, are genetically different from hospital or healthcare-acquired MRSA. This indicates the community strains didn’t “escape” from the hospital to the community but rather that they became resistant on their own.

HOW IS MRSA SPREAD FROM PERSON-TO-PERSON?
MRSA most often spreads by direct skin-to-skin contact or by surface-to-skin contact.

HOW CAN MRSA AFFECT PEOPLE?
MRSA can affect people in two ways: colonization or infection. When a person carries the flora on the skin or in the nose without showing signs or symptoms of infection, the person is said to be colonized. If a person has signs of infection that are caused by MRSA (such as abscesses, wound infections, pneumonia, respiratory infections, blood, stool or urinary tract infections) the person is said to be infected.

WHAT DOES A STAPH OR MRSA INFECTION LOOK LIKE?
Staph bacteria, including MRSA, can cause skin infections that may look like a pimple or boil and can be red, swollen, painful or have pus or other drainage. More serious infections may cause pneumonia, bloodstream infections, or surgical wound infections.

HOW CAN YOU STOP THE SPREAD OF MRSA?
The single most effective way to help prevent the spread of infection is with proper hand hygiene. Wash hands with an antimicrobial hand soap for at least 15 seconds and rinse with warm running water or apply an alcohol-based hand sanitizer. Also cover any open skin area such as abrasions or cuts with a clean dry bandage; avoid sharing personal items such as towels or razors; use a barrier (e.g., clothing or a towel) between your skin and shared equipment; and wipe surfaces before and after use with an appropriate EPA-registered disinfectant.

WHAT SHOULD I DO IF I THINK I HAVE A MRSA INFECTION?
See your healthcare provider.

Visit www.cdc.gov/MRSA for more information
Ecolab has developed a wide range of products to help halt the spread of MRSA in school environments. The following are some of the most effective EPA-registered surface disinfectants and skin care products proven to destroy MRSA when used according to label directions.

**SKINCARE**
- **BACTI-STAT®**
  Antimicrobial Hand Soap
- **QUIK-CARE™**
  Waterless Foam Hand Sanitizer
- **ENDURE® 300 CIDA RINSE GEL**
  Waterless Gel Hand Sanitizer
- **ENDURE® 320 ADVANCED CARE**
  Waterless Gel Hand Sanitizer with Moisturizers
- **ENDURE® 420 CIDA STAT**
  2% CHG Antimicrobial Skin Cleanser and Surgical Scrub
- **DIGICLEAN™ HEALTHCARE PERSONNEL HANDWASH FOAM**

**SURFACE DISINFECTANTS**
- **20 NEUTRAL CLEANER AND DISINFECTANT**
- **14 ANTIBACTERIAL ALL PURPOSE CLEANER**
- **OASIS™ 531 NEUTRAL DISINFECTANT CLEANER**
- **OASIS™ 499 HBV DISINFECTANT**
- **TB DISINFECTANT CLEANER READY TO USE**
- **QUANTUM TB DISINFECTANT**

The single most effective way to help prevent the spread of infection is **PROPER HAND WASHING.**
